

Virtual machine setup tutorial

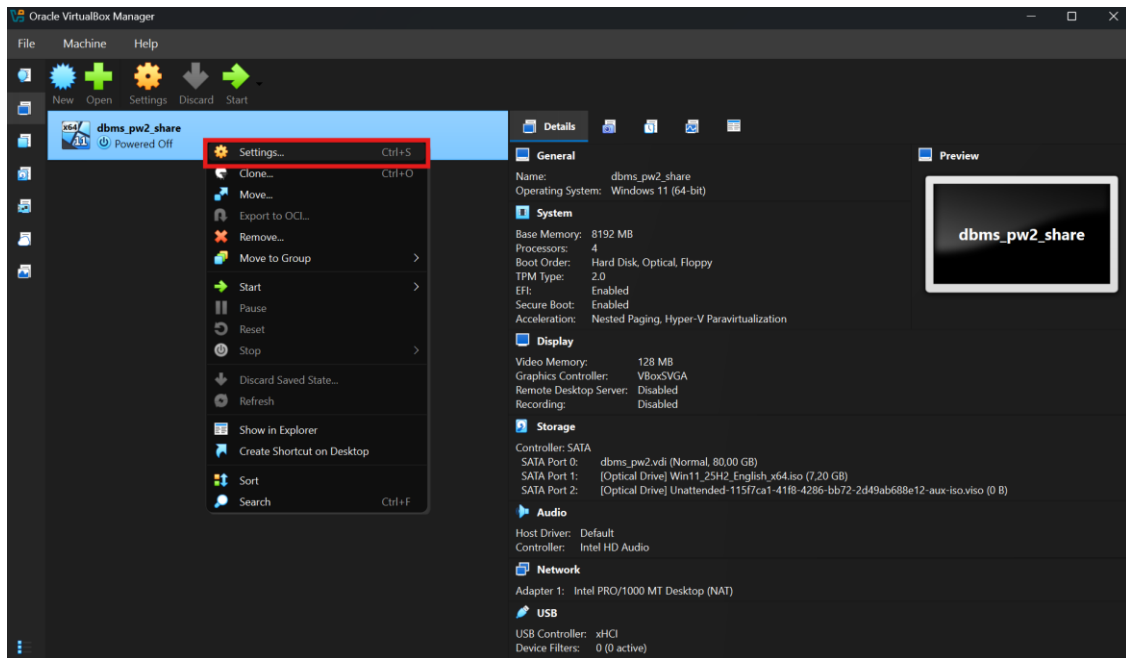

After downloading the provided virtual machine folder and installing Oracle VirtualBox (available at: <https://www.virtualbox.org/wiki/Downloads>) open Oracle VirtualBox and you should see this screen. Press the *open* button.

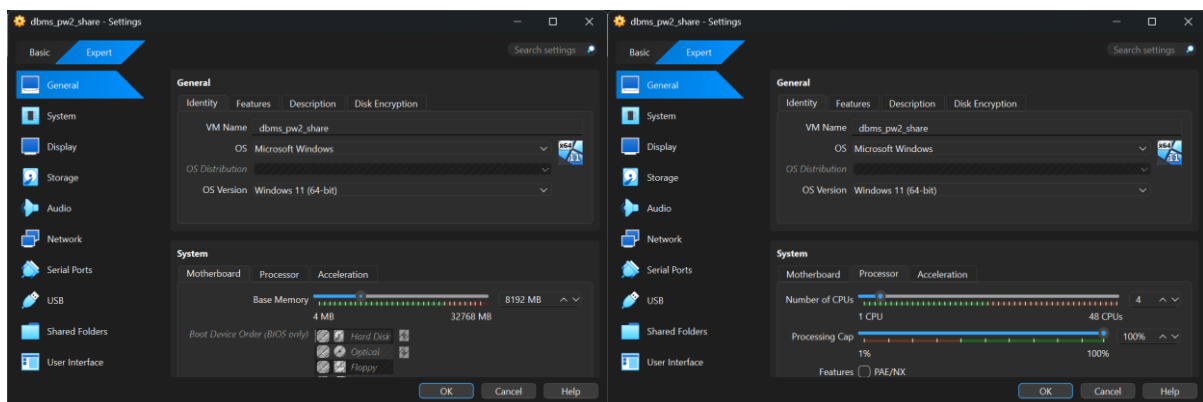

Navigate to the folder that you downloaded and extracted the virtual machine and open the *.vbox* file.

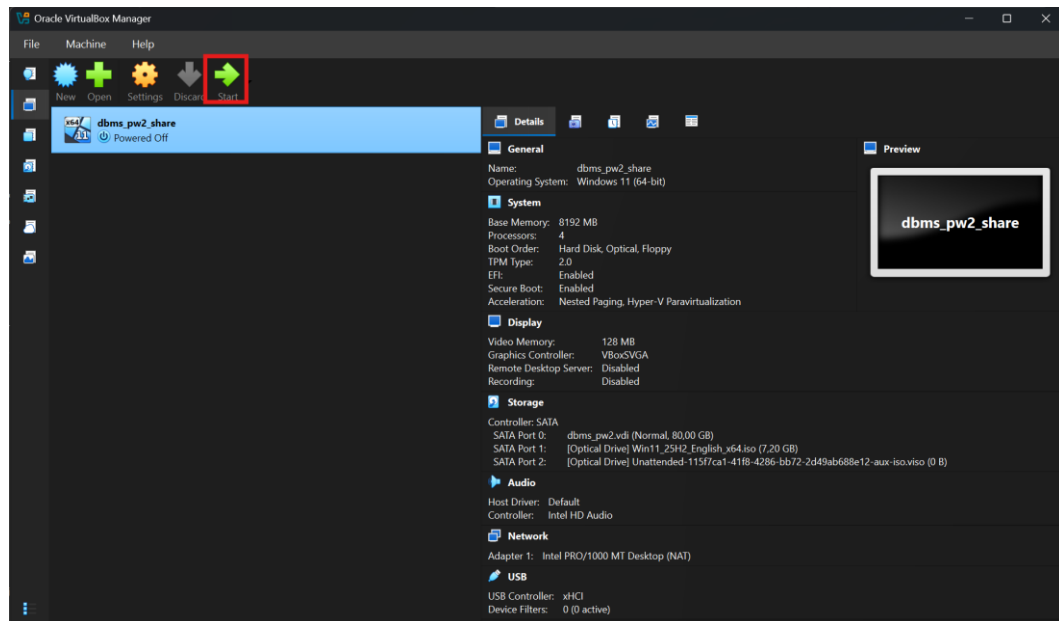

Now on the main screen you should see that a virtual machine was added. Right-click on it and click on setting to open the machine specific settings.

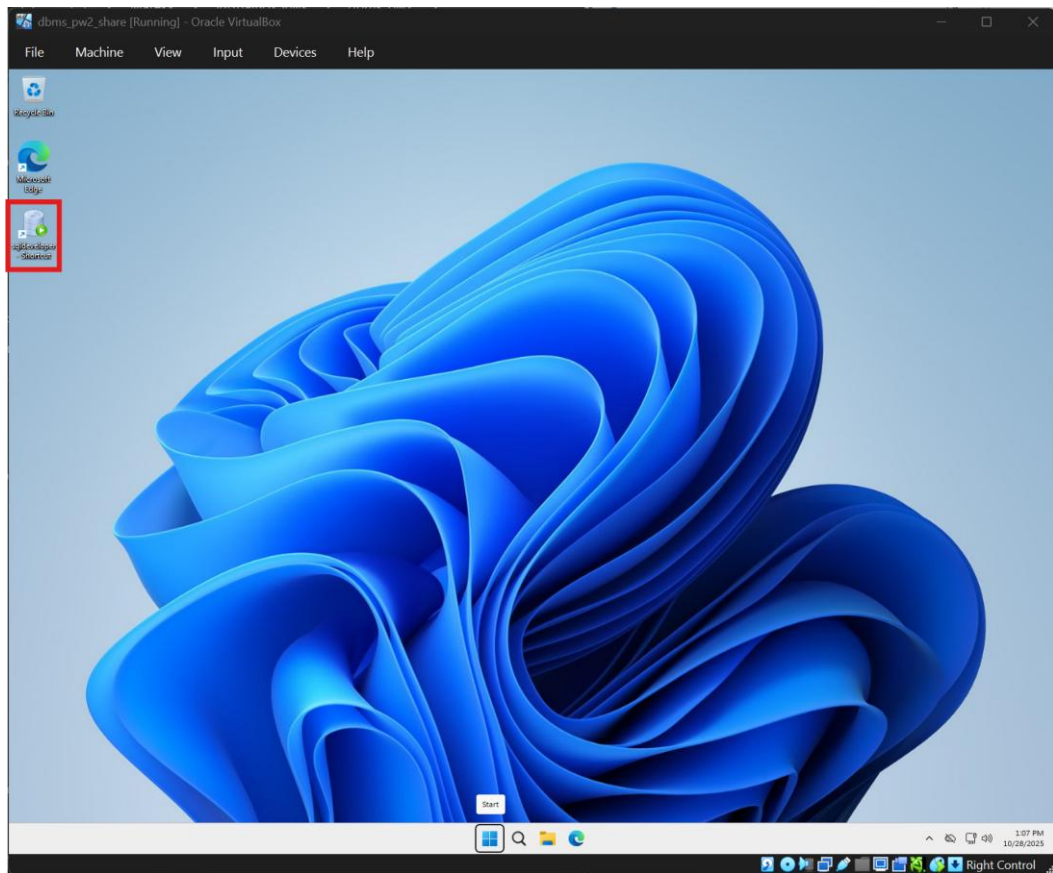

When the machine settings are open ensure that the System > Motherboard tab, has at least 4GB of Base Memory (8GB or more is recommended). Also check if the System > Processor subtabs have at least 4 CPUs (If you can allocate more, that is recommended). If altering these values, make sure not to exceed the green area on the sliders.

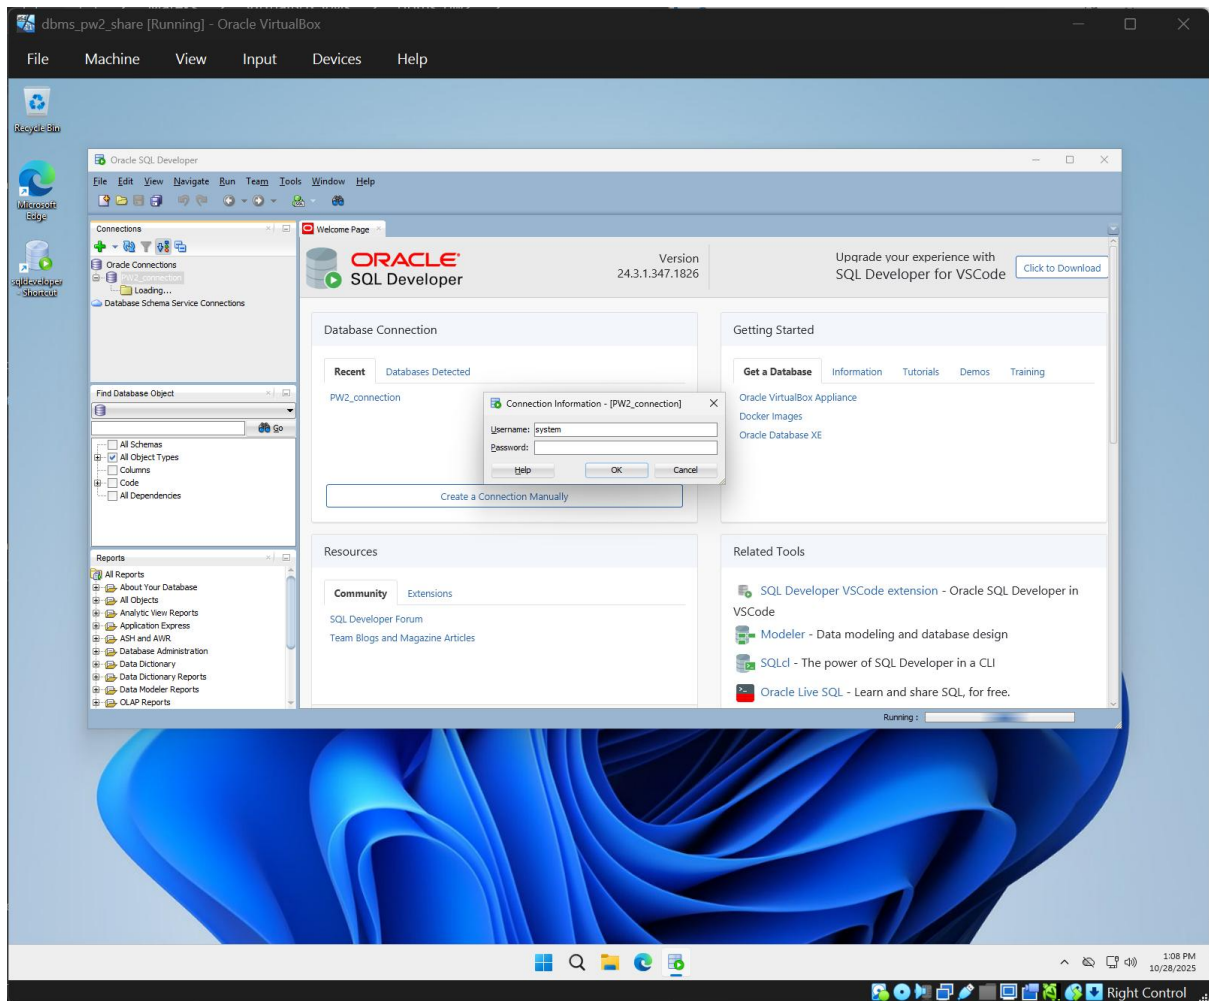

After these checks, you can now start the virtual machine. On the main screen, select the added machine and press **Start**. Wait for a bit for the machine to boot up.

After the machine boots up, you should be automatically logged in as Windows user “dbmsuser”. If you are asked for a password, then **all passwords** that you need to use in this virtual machine **are** set to: **0000**. (number zero) After the virtual machine has booted up, you can open SQLDeveloper that has a shortcut on the desktop.

After opening SQLDeveloper, there already is a connection that is set up with all required permissions to complete PW2. Again if you are asked for a password – **all passwords are set to: 0000**

After making a connection, good luck with PW2!
